IOCS meeting
6-8 May 2013 Darmstadt Germany

Why we want PFTs?

e.g) Cocolithophores

Orr et al., 2005

Also, Ca-fixers may be vulnerable to the ocean acidification, in such a case their change can be used to infer impact of the acidification on marine ecosystems

NATURE|Vol 451|17 January 2008|doi:10.1038/nature06592

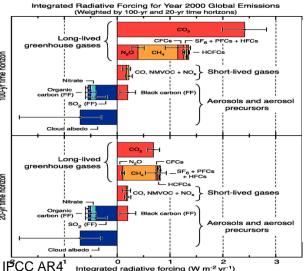

An Earth-system perspective of the global nitrogen cycle

Nicolas Gruber & James N. Galloway With humans having an increasing impact on the planet, the interactions between the nitrogen cycle, the arbon cycle and climate are expected to become an increasingly important determinant of the Earth system. Fossil-fuel burning Industria Lightning Atmosphere Fertilize Nitrification and denitrification and denitrification NO3 and NH4 NH_{A} Ocean 'Biological' Reactive 'Biological' carbon nitrogen nitrogen Biological' Figure 1 | Depiction of the global nitrogen cycle on land and in the phosphorus. Blue fluxes denote 'natural' (unperturbed) fluxes; orange

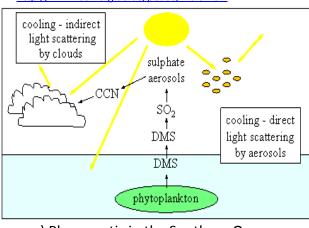

YEAR OF PLANET EARTH FEATURE

Figure 1 | Depiction of the global nitrogen cycle on land and in the ocean. Major processes that transform molecular nitrogen into reactive nitrogen, and back, are shown. Also shown is the tight coupling between the nitrogen cycles on land and in the ocean with those of carbon and

phosphorus. Blue fluxes denote 'natural' (unperturbed) fluxes; orange fluxes denote anthropogenic perturbation. The numbers (in Tg N per year) are values for the 1990s (refs 13, 21). Few of these flux estimates are known to better than +20%, and many have uncertainties of +50% and larger 1321.

e.g.) Phaeocystis in the Southern Ocean

Who is playing a "critical role" within an ecosystem? Its answer is important for "ecosystem stability", hence "ecosystem-based management"

Big eats small. Size is a matter.

Megrey et al., 2007
