# Product Type and Size

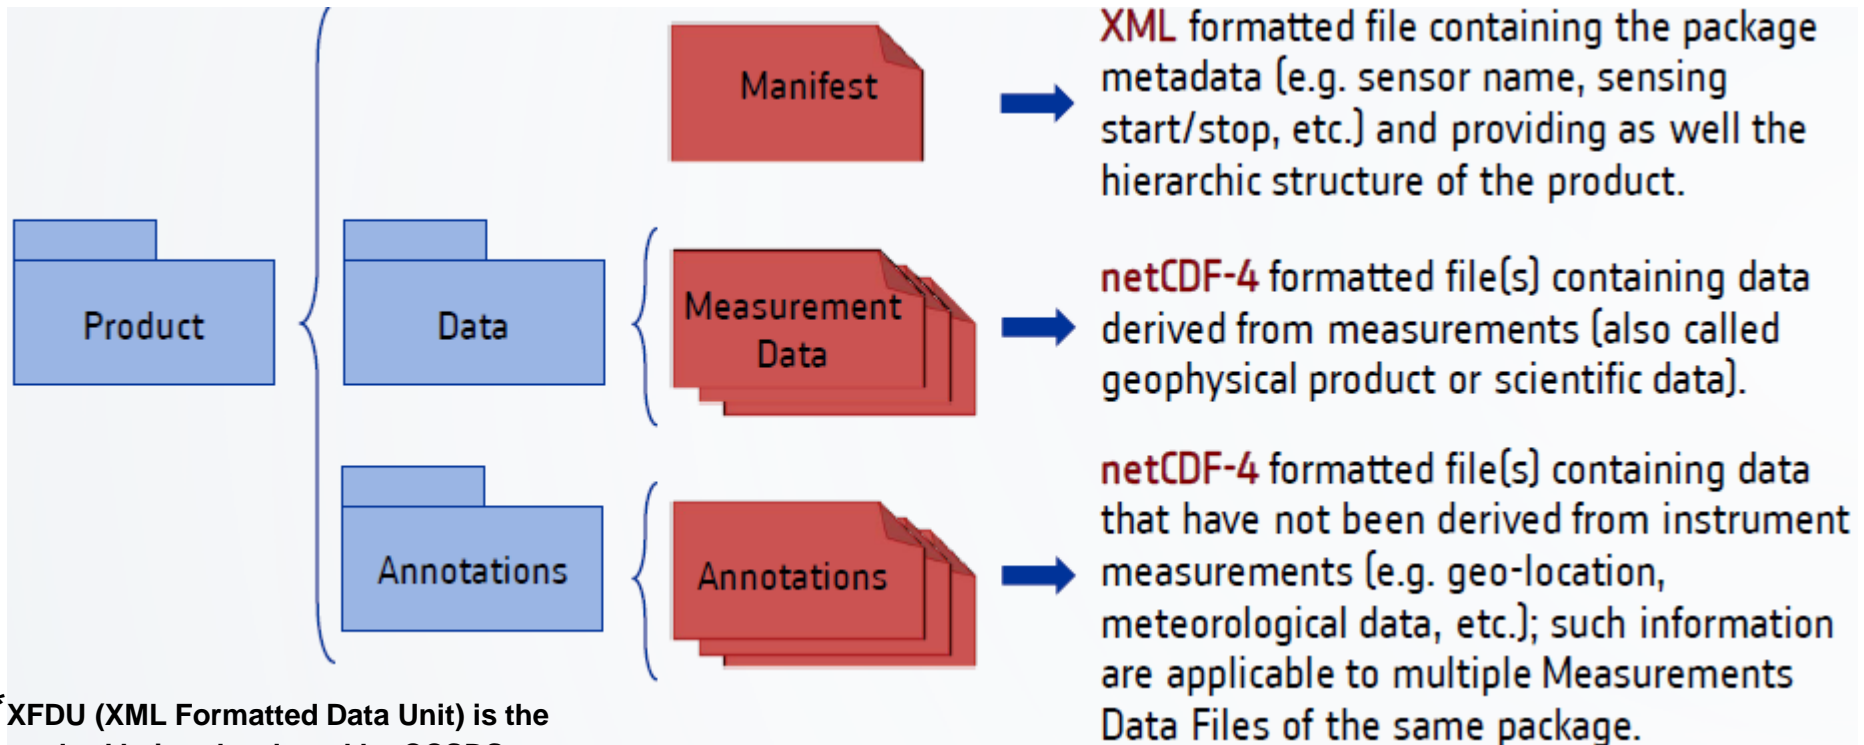

<b>PRODUCT TYPE</b>	<b>LEVEL</b>	<b>DESCRIPTION</b>	<b>SIZE (GBYTE/ORBIT)</b>
<b>OL_1_EFR___</b>	<b>1</b>	<b>Full Resolution top of atmosphere</b>	<b>29.90</b>
<b>OL_2_WFR___</b>	<b>2</b>	<b>Full Resolution Water &amp; atmosphere parameters</b>	<b>33.40</b>
<b>OL_2_LFR___</b>	<b>2</b>	<b>Full Resolution Land and Atmosphere parameters</b>	<b>7.32</b>
<b>OL_1_ERR___</b>	<b>1</b>	<b>Reduced Resolution top of atmosphere</b>	<b>1.70</b>
<b>OL_2_WRR___</b>	<b>2</b>	<b>Reduced Resolution Water &amp; atmosphere parameters</b>	<b>2.10</b>
<b>OL_2_LRR___</b>	<b>2</b>	<b>Reduced Resolution Land and Atmosphere parameters</b>	<b>0.50</b>

# Product Format

The raw data acquired by the Sentinel-3 satellite are processed according to three levels of data processing: Level 0 (reconstructed and time sorted ISP), Level 1 (TOA radiometric measurements, radiometrically corrected, calibrated and spectrally characterised), Level 2 (geolocated geophysical products).

The Sentinel-3 products are organized in packages, following a **XFDU specialization\*** (**SENTINEL SAFE** format). A Product Package is a physical collection of files grouped under a single directory, using a defined packaging scheme.

\*XFDU (XML Formatted Data Unit) is the standard being developed by CCSDS

**Notes:**

"BAC" stands for "Baseline Atmospheric Correction algorithm" and it is a Meris heritage [R-C]. The BAC is used for the operational output of the reflectances of this product package.

## LEVEL 2 WATER GEOPHYSICAL PRODUCTS DESCRIPTION

OLCI Instrument		
<i>Geophysical Product</i>	<i>Description</i>	<i>Algorithm</i>
<b>Water-leaving reflectance</b>	Surface directional reflectance, corrected for atmosphere and Sun specular reflection	Based on the Antoine and Morel method developed for MERIS (1998); multiple scattering algorithm where the path reflectance is derived globally instead of assessing separately $\rho_a$ and $\rho_r$ . Aerosol properties and diffuse transmittance are retrieved from LUTs generated from RT computations.
<b>CDM Absorption coefficient</b>	Absorption of Coloured Detrital and Dissolved Material at 443 nm	Retrieved from directional water leaving reflectance using a Neural Network as a multiple non-linear regression technique. The coefficients of the NN are determined by a training process based on the usage of a radiative transfer model including a bio-optical model describing the water IOPs.
<b>Algal pigment concentration</b>	Chlorophyll-a concentration	Retrieval based on two different algorithms: <ol style="list-style-type: none"> <li>1. the "OC4Me" algorithm (Morel et al. 2007a). It is a polynomial based on the usage of a semi-analytical model;</li> <li>2. from the phytoplankton pigments absorption coefficient obtained as output from a NN. The IOPs retrieved via the NN are converted into concentration of water constituents (e.g. CHL) by simple regression.</li> </ol>
<b>Total Suspended Matter concentration</b>	Total Suspended Matter concentration	Computed from the total backscattering coefficient obtained as output from a Neural Network. The IOPs retrieved via the NN are converted into concentration of water constituents (e.g. TSM) by simple regression.
<b>Diffuse attenuation coefficient</b>	Diffuse attenuation coefficient for downwelling irradiance at 490 nm	OK2-520 algorithm (Morel et al. 2007); based on a polynomial using the 490-560 reflectance ratio and pre-defined coefficients.
<b>Photosynthetically active radiation</b>	Quantum energy flux from the Sun in the spectral range 400-700 nm.	Derived from the irradiance above water pixels, under a tabulated relationship. The provided geophysical product is an instantaneous PAR (iPAR).
<b>Aerosol optical thickness</b>	Aerosol load expressed in optical depth at 865 nm	By-products of the atmospheric correction
<b>Aerosol Ångström exponent</b>	Spectral dependency of the aerosol optical depth between 779 and 865 nm	By-products of the atmospheric correction
<b>Integrated water vapour column</b>	Total amount of water vapour integrated over an atmosphere column	Based on the exploitation of the pronounced water vapour absorption band around 950 nm using the differential absorption of water vapour. Retrieval limited to daytime observations above cloud-free regions. It is best applicable over land, whereas over ocean only sea ice and sun glint regions can be sensed with a comparable accuracy. Due to the dominating influence of atmospheric scattering over dark surfaces, a reduced accuracy over ocean is to be expected

- Format SENTINEL SAFE package → XML + NETCDF4
- 1 measurement data set = 1 netcdf-4 (measurement + uncertainty)
- 1 Annotation = 1 netcdf-4
- Format, product description, algorithm will be available with the SENTINEL-3 product handbook later 2013/2014
- 2 Posters at IOCS:
  - Sentinel-3 Optical Sensors Products and Algorithms, (Carla Santella et al.)
  - The Sentinel-3 Payload Data Ground Segment (Carolina Nogueira Loddo et al.)
